"A Cathode-Ray Memory Tube With Barrier Grid as an Electronic Circuit Element"

Avtomatiz. proyektir. v elektron. Resp. mezhved. nauch.-tekhn. sb. (Design Automation in Electronics. Republic Interdepartmental Scientific and Technical Collection), vyp. 2, Kiev, "Tekhnika", 1970, pp 151-155

Abstract: The cathode-ray memory tube with barrier grid is represented as a nonautonomous multiterminal network to which a generalized conductivity matrix Y is ascribed. The authors find the equivalent parameters of the tube which enable investigating its properties as a circuit element. Three illustrations, bibliography of three titles.

"A Device for Measuring the Amount of Oxygen Absorbed by Different Parts of the Human Skin"

Kiev, Vrachebnoye Delo, No 6, Jun 71, pp 119-122

Abstract: An apparatus for determining the amount of O_2 that is absorbed by different areas of the human skin has been developed, which comprises 1) an electrolytic O_2 compensator consisting of a vessel filled with a $CuSO_4$ solution and equipped with two electrodes, 2) a gas-exchange vessel with an absorber for CO_2 and H_2O , 3) a liquid-filled U-shaped manometer with a floating contact, and 4) an electronic recorder, a power source, integrating unit, and monitoring indicators.

After a certain volume of O₂ has been absorbed by the skin, the pressure in (2), which has been initially equal to that in (1), decreases, activating (3) with the result that the floating contact in one of the legs of (3) is lowered and current passes through (1), developing O₂ that flows into (2). Current passes through (1) until an equal pressure in (2) and (1) is restored. When more O₂ has been absorbed from (2) by the skin, the cycle is repeated. The amount of current that passes through (1), which is equivalent to the amount of O₂ absorbed by the skin, is measured and recorded. At a consumption of O₂ less than 5-10 cm³, a more precise electrolytic contact is used that consists of a 2d U-tube filled with a liquid electrolyte that rises in one of the legs of the tube when the pressure in (2) drops, unbalancing the liquid levels in the first U-tube. The rising liquid in the 2d tube establishes a contact between two electrodes that are located in the leg of the U-tube. Application of the apparatus on 20 healthy persons yielded satisfactory results.

"A Television Device for Determining the Coordinates of Point Objects"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki,
No 26, Sep 71, Author's Certificate No 313210, p 165

Translation: This Author's Certificate introduces a television device for determining the coordinates of point objects. The device contains a television transmitting tube with memory, an output scanning unit, a video signal processing unit, an erasure unit, a synchronizing unit, a cadence pulse generator, an optical shutter, and a data input module. As a distinguishing feature of the patent, the accuracy of coordinate determination is improved by tying series-connected horizontal and vertical interrogation counters to the output of the cadence pulse generator. The counter outputs are connected through shaping matrixes for horizontal and vertical deflection to the input of the output scanning unit. At the same time, a second output of the vertical interrogation counter is connected through a decoder to the data input module.

ABSTRACT. ION EXCHANGE FILTERS WITH
ECONOMICAL THAN THOSE WITH INTERNAL REGENERATION. THE CONSUMPTION OF
REAGENTS AND CONDENSATES IS LESS FOR THE FORMER FILTERS IN VIEW OF
BETTER REGENERATION CONDITIONS WHICH IS THE CAUSE OF INCREASED EXCHANGE
OPERATING CAPACITY. THE MAX. ADMISSIBLE FILTRATION RATE OF FILTERS WITH
INTERNAL REGENERATION IS 50M-HR; FOR FILTERS WITH EXTERNAL REGENERATION
THIS RATE MAY BE HIGHER. LOSSES IN ION EXCHANGER WITH EXTERNAL
REGENERATION ARE NOT GREATER THAN THOSE WITH INTERNAL REGENERATION
FILTERS.

Proyektirovaniye Magnitnykh i Poluprovodnikovykh Elementov Avtomatiki (The Design of Magnetic and Semiconductor Elements for Automatic Equipment), Moscow, "Energiya," 1970, 639 pp, Summary p 2, Table of Contents pp 635-639

Translation of Summary and Table of Contents: The book sets forth questions in the theory and design of the principal types of ferromagnetic and semiconductor elements used in automatic control and monitoring systems.

The first part of the book presents information necessary for understanding the operating principles and principal characteristics of elements. Considerable attention is given to quantitative relations enabling the static and dynamic characteristics of elements to be evaluated.

The second part gives methods of calculation, as well as necessary data on the design of widely used elements. The calculation methods are illustrated by examples which make it possible for the reader both to learn the calculation sequence and to determine the order of calculated values.

"Cam Plastometer"

USSR Author's Certificate No 265518, Filed 26 Oct 68, Published 10 Jul 70
(from RZh-Metallurgiya, No 4, Apr 71, Abstract No 41959)

Translation: The invention pertains to techniques and equipment for studying the properties of metals and alloys under various thermomechanical strain conditions. The proposed cam plastometer differs from the known ones by the fact that an additional control cam is rigidly attached to the flywheel. The additional cam is phase-shifted with respect to the operating cam and interacts with the rack and pinion inclusion mechanism on the pinion shaft of which a cam is rigidly attached with a stud which closes the kinematic loading circuit. Stability of inclusion of the kinematic loading circuit in a broad range of deformation rates of the tested sample is insured with this execution of the device.

"Polarization of the Emission of Axisymmetric Mirror Antennas"

Moscow, Radiotekhnika i Elektronika, Vol 17, No 4, Apr 72, pp 680-686

Abstract: The authors analyze polarization of the emission of axisymmetric multiple-reflector antennas, i. e. Cassegrainian or modified Cassegrainian systems, systems with a spherical mirror, and also systems in which the reflectors are segments of axisymmetric mirrors (systems with a remote radiator, parabolic horn antennas). A study is made of the field of asymmetry of the emitter, i. e. the influence of rotating the emitter relative to the axis of the system and the difference between its polar diagrams in the E- and H-planes. It is shown that there is no transverse cross polarization component for emitters of "optical" type, e. g. horns. The cross polarization component of the polar diagram is investigated.

Discussion of the problem of the motion of a liquid in open
cylindrical U- and V-shaped tanks, in the case where a tank moves
along the generating line according to a given law. A solution to the
problem is obtained by reducing the equations of motion of an ideal
incompressible fluid to systems of equations analogous to the
equations of motion of a plane unsteady compressible gas flow with
a polytropic index of two. It is shown that the longitudinal force is
independent of time and the tank length. V.P.

Translation: In order to determine the accuracy and information content
of the functioning of electronic models reflecting the properties of
sensory systems, a method has been developed for testing the accuracy,
reaction time and quantity of information in the output signal in re-
lationship to the input. The expediency is proven of testing these
parameters in determining the identity of the operation of the models.

"Quinindines. VII. Study of the Synthetic Routes of β -Quinindene"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 1, Jan 71, pp 102-107

Abstract: Various approaches to the synthesis of β -quinindene (I) are discussed. Rearrangement of acetic anhydride of β -quinindane-N-oxide followed by hydrolysis and dehydration gives a dimer of (I). (I) can be obtained by dehydrobromination of 3-bromo- β -quinindane (II) which could be synthesized by converting β -quinindane to a 3-lithium derivative and reacting it with cyanogen bromide at -15°. Dehydrobromination of (II) was achieved by heating it in dimethylformamide for 30 min on a steam bath in presence of triethylamine. (I) is very unstable; it dimerizes in acid medium and on heating. PMR data indicated that the product, in spite of giving only a single spot on the TLC plates, actually represented a mixture of 1H- and 3H- β -quinindene.

V sb. Poluprovodn. pribory i ikh primenenie (Semiconductor Devices and Their Applications -- Collection of Works), Vyp. 22, Moscow, "Sov.radio," 1969, pp 13-28 (from RZh-Elektronika i yeye primeneniye, No 4, Apr 70, Abstract No 4B195)

Translation: Parametric semiconductor diodes (SD) with a metal--n GaAs--n + GaAs structure are investigated. On the basis of a calculation of the resistance of a SD, with the surface microwave frequency -- losses taken into account, the advantage of the use of epitaxial films is shown. Epitaxial layers of n-type GaAs with an impurity concentration of $5 \cdot 10^{15} - 10^{17} \text{ cm}^{-3}$ and a thickness of 0.5--2 microns were obtained by the method of gas-transport reactions in a circulating system with the use of AsCl_3 and Ga as the parent substance. The substrates were made of GaAs, doped 1/2

with Te up to concentrations of 10^{19} cm^{-3} . The planar SD were prepared either by chemical precipitation of Ni or by deposition of Au or Ag in a SiO_2 window, applied on the GaAs surface by the method of cathode sputtering of Si in an O_2 atmosphere. The diameter of the window prepared by photolithography amounted to 5--25 microns. Annealing of the SD performed in a N_2 atmosphere showed that the maximum temperature for Au-GaAs, Ag-GaAs and Ni-GaAs contacts was 230, 300, and 450° , respectively. The capacitance and time constant of the experimental SD with a Schottky barrier constituted 0.01--0.1 nanofarad and 0.15--0.6 nanosecond at frequencies of 10 and 35 GHz. A. Ye.

"Derivatives of Dialkylphosphonic Acid Ethyleneamides"

Leningrad, Zhurnal Obshchey Khimii, Vol 42 (105), No 4, Apr 73, pp 739-743

Abstract: Reaction of phosgene with ethyleneamides of dialkylphosphoric acids leads to the formation of N-dialkylphosphono-N-(2-chloroethyl)carbamic acid chlorides which react with ammonia, amines, potassium salt of diisopropylthiolthione phosphoric acid, and sodium azide to yield respective derivatives. N-Dialkylphosphonoimidazolidenones-2 can be obtained by reacting N-dialkyl-phosphono-N-(2-chloroethyl)ureas with a base.

"Isocyanates of Cyclic Ethers and Etheramides of Phosphorus Acids"
Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70,
pp 1942-1948

Abstract: In continuation of previous work, 2-chloro-4-methyl-phosphorinane, N-methyl- and N-phenyl-2-chloro-1,3,2-oxazaphospholanes were reacted with sodium cyanate to yield 2-isocyanato-4-methylphosphorinane and N-methyl- and N-phenyl-2-isocyanato-1,3,2-oxazaphospholanes. These products are soluble in most organic solvents except petroleum ether; they react slowly with water and easily add a sulfur atom when heated with phosphorus thiocloroxide. 2-Isocyanato-2-oxophospholane and 2-isocyanato-2-oxo-4-methyl-phosphorinane react violently with water and easily add alcohols, oximes, enamines, and hetero cyclic methylene bases at the isocyanate group. Their thioanalogues react much slower with water and other nucleophilic compounds.

"Data Gathering System"

Moscow, Pribory i tekhnika eksperimenta, No 1, Jan-Feb 71, pp
89-93

Abstract: The data gathering system is defined as the control of the parameters of a system under test through the accumulation of data with a minimal expenditure of human labor and in a form convenient for input to an electronic computer. The system considered in this paper is based on a switching analog-digital converter. Signals from various sensors feed into the switching device, which is directed by a control apparatus to select a single signal for input to the converter, and thence to a linearizer, a frequency meter, and a readout device in succession. The exchange of signal information among these blocks is indicated in an accompanying block diagram and is explained in the text together with an account of what happens inside each of the blocks.

"On the Retention of Condensate Particle Crystallization in the Nozzle of a Jet Engine"

Kazan', Izvestiya vysshikh uchebnykh zavedeniy - Aviatsionnaya tekhnika, No. 2, 1971, pp 24-31.

Abstract: The effect of crystallization retention of condensate particles in the nozzle on the power characteristics of a jet engine are discussed. It is noted that in the standard technique for calculating the thermodynamic characteristics of rocket fuels, it is assumed that the expansion process in the nozzle is an equilibrium process. For fuels with two-phase combustion products this indicates that under expansion the temperature and rate of the particles and the gas are equal and the condensate as it cools in the nozzle passes uniformly through phase states. For example, the combustion products of solid fuels with Al additives contain 15-35% condensed aluminum oxide which has a melting point of 2303°K. The combustion temperature of these fuels is 3000-3500°K and the temperature of products at the cutoff of the nozzle is 1500-2000°K. The aluminum oxide particles in the combustion chamber are in the cold state according to an equilibrium thermodynamic calculation; the temperature of the products reaches 2303°K upon expansion in a certain cross section of the nozzle. The expansion process subsequently occurs isothermally until the 1/2

USSR

TISHIN, A. P., et al, Izvestiya vysshikh uchebnykh zavedeniy - Aviatsionnaya tekhnika, No. 2, 1971, pp 24-31

heat of aluminum oxide crystallization is transformed into kinetic energy. In this section of the nozzle the condensate gradually transforms from the liquid to the solid state as heat is transferred to the gas. In each cross section the amount of hardened concentrate is equal to the amount of heat of crystallization removed. In the actual case the equilibrium process may be limited, first by the finite rate of crystallization and second by the finite rate of heat transfer from particles to the gas. Results of an approximate thermodynamic calculation and of special thermodynamic calculations of two compositions with 7 and 15% aluminum are given for determining the relative effectiveness of the expansion process in the absence of crystallization. Also given are the results of calculations of known equilibrium flows of two-phase combustion products of a composition with 15% Al for the study of the effect of the rate of heat exchange between particles in the gas on the crystallization process. It is shown that in a real case the phase transition heat may be achieved in the nozzle to a considerable degree only under suitable conditions of heat exchange between the particles and the gas.

"Nature of the Strengthening of Maraging Steel"

Moscow, Fizika i Khimiya Obrabotki Materialov, No 5, Sep-Oct 70,
pp 151-153

Abstract: A previous article by the authors reported the anomalous effect of decreased strength with 90% deformation of steel pre-aged at 475°. The article showed that an ultimate strength of 250-270 kg/mm² can be obtained in maraging steel after combined treatment. The present article attempts to study the nature of the high strength of maraging steel. Maraging steel with the composition 18% Ni, 8% Co, 5% Mo, and 1% Ti was treated under the following regime: hardening + aging + deformation (with shrinkages of up to 90%) + aging. Hardening was performed from 950° C in air. The first aging was under the following conditions: 375° for 1 hour, 475° 30 min. and 475° 3 hours. Re-aging took place at 450° for 3 hours. The results indicate that aging processes take place

1/2

USSR

BLANTER, M. YE., et al., Fizika i Khimiya Obrabotki Materialov,
No 5, Sep-Oct 70, pp 151-153

in maraging steel during deformation at room temperature, and
the increase in deformation hardness is due not only to cold
hardening, but also to precipitation hardening. A study of data
on variations in the electrical resistance and lattice parameter
of the solid solution indicates that back dissolution of streng-
thening zones occurs in steel pre-aged at 475° C, and this re-
sults in reduced strength of the steel under 90% deforma-
tion.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHORS STUDIED THE ACTIVITY OF LACTIC, MALICDEHYDROGENASE AND THE ZINK CONTENT IN THE BLOOD SERUM OF 178 PATIENTS WITH DIFFERENT FORMS OF CORONARY INSUFFICIENCY WITH A VIEW TO FINDING THE GENESIS OF HYPERENZYMEIA OF THESE ZINK CONTAINING DEHYDROGENASES. THERE IS AN INDIRECT CORRELATION IN THE CHANGES OF LACTICDEHYDROGENASE AND ZINK. TAKING INTO CONSIDERATION A GREAT NUMBER OF COINCIDENCES IN THE DEGREE OF DEVIATIONS OF ZINK AND CORRELATION BETWEEN THEM THE AUTHORS CAME TO THE CONCLUSION THAT PROLONGED HYPERENZYMEIA IN ACUTE MYOCARDIAL INFARCTION IS NOT ONLY THE RESULT OF ELIMINATION OF THE ENZYME FROM THE CHANGED CELLS OF THE MYOCARDIUM INTO THE BLOOD BUT ALSO THE CONSEQUENCE OF PECULIAR INTERRELATION WITH ZINK.

"High-Resolution Counters Of Germanium With Radiation-Induced Defects"
Fizika i tekhnika poluprovodnikov, Vol 6, No 4, Apr 1972, pp 779-781

Abstract: The characteristics are presented of counters obtained as usual on the
basis of germanium with $N_D = N_A \sim 10^{12}$ cm⁻³ but with a decrease of more than
one order of magnitude of the background of impurities and defects N_F . The ampli-
tude spectrum of a specimen of ¹⁹⁷Ge is shown. The resolution of the counters at
this line is less than $R = 1.2$ percent. The dependence is shown of the constant
capture time on the electrical field intensity. 2 fig. 13 ref. Received by
editors, 5 Nov 1971.

"On the Resolving Power of Silicon Lithium-Drift Detectors"

V sb. Razvitiye yadern. i izotopn. priborostr. Tr. Konferentsii spetsialistov stran-chlenov SEV, 1969. Ch. 1 (Development of Nuclear and Isotope Instrument Building. Works of the Conference on Specialists of Member Countries of the Council for Mutual Economic Aid, 1969. Part 1 -- Collection of Works), Moscow, 1970, pp 199-206 (from RZh-Fizika, No 1, Jan 71, Abstract No 1A694)

Translation: The effect of specific resistance, the lifetime of nonbasic current carriers, and the dislocation density of p-type silicon on the energy resolution of detectors made by the lithium-drift method was investigated. It is shown that in detectors with good compensation by lithium the energy resolution is determined by the average magnitude and spread of the lifetime over the area of the Si plate. In the case of insufficiently good compensation, fluctuations in the process of charge accumulation and, consequently, the energy resolution will also depend on fluctuations in the electric field. It was observed that the magnitude

AFANAS'YEVA, N. P., et al, Razvitiye yadern. i izotopn. priborostr. Tr. Konferentsii spetsialistov stran-chlenov SEV, 1969. Ch. 1, Moscow, 1970, pp 199-206.

of fluctuations in the process of charge accumulation increases with an increase in the heterogeneity of the specific resistance and also with time if the detectors are kept at room temperature without reverse grid bias. Satisfactory agreement was observed between the measured value of the noise and the calculated level of shot noise produced by the flow of current caused by volume or surface regeneration of pairs (i.e., for the case in which surface conductivity can be neglected). The magnitude of the contribution of excess noises to the energy resolution is linearly dependent on the leakage current (slope 20 kev/ μ a). It is hypothesized that leakage currents arise as a result of "decompensation" of the material (for example, close to the surface). In studying the effect of the material parameters on intermediate stages in making the detectors, it was observed that the leakage current of a diffusion pn-junction increases with an increase in dislocation density.

"The Effect of Silicon Parameters on the Characteristics of Surface-Barrier Gold-Silicon Detectors"

V sb. Razvitiye yadern. i izotopn. priborostr. Tr. Konferentsii spetsialistov stran-chlenov SEV, 1969, Ch. 1 (Development of Nuclear and Isotope Instrument Building. Works of the Conference of Specialists of Member Countries of the Council for Mutual Economic Aid, 1969, Part 1 -- Collection of Works), Moscow, 1970, pp 229-234 (from RZh-Fizika, No 1, Jan71, Abstract No IA688)

Translation: The effect of specific resistance, lifetime of nonbasic current carriers, dislocation density, and heterogeneity and the distribution of these parameters on the characteristics of surface-barrier Si-detectors were investigated for the purpose of producing detectors with a large working area and a high energy resolution. In making the detectors, particular attention was given to lowering surface leakage at the boundaries of the gold contact. Measurements of

AFANAS'YEV, V. F., et al, Razvitiye vadern. i izotopn. priborostr. Tr. Kon-
ferentsii spetsialistov stran-chlenov SEV, 1969, Ch. 1, Moscow, 1970, pp 229-
234.

the energy distribution of the detectors as a function of the heterogeneity of silicon in terms of the lifetime of the carriers and specific resistance are given. In studying the effect of dislocation density N_d on reverse current and the working voltage of surface-barrier detectors, it was observed that an increase in N_d leads to a rise in leakage current that also depends on the value of the electric field in the surface barrier. At a low dislocation density $N_d \approx 10^3 \text{ cm}^{-3}$, the leakage currents vary very little with the electric field, whereas for $N_d \approx 5 \cdot 10^4 - 10^5 \text{ cm}^{-3}$, these changes are more considerable. Such relationships are explained by the rise of microplasmas at the dislocations. On the basis of these results criteria were established for selecting silicon of domestic production with which one could obtain detectors with an energy resolution of 0.5, 0.17, and 0.1% (for $E^Q = 5 \text{ Mev}$) with a working area of 2,3, and 5 cm^2 respectively.

"A Variation Method of Estimating Minimum Variance Under Conditions of 'Contamination'"

Tr. 4-y Zimm. shkoly po mat. programmir. i smezh. voprosam, 1971, vyp. 2
(Works of the Fourth Winter School on Mathematical Programming and Related
Problems, 1971, No 2), Moscow, 1971, pp 180-196 (from RZh-Kibernetika, No
5, May 72, Abstract No 5V111)

Translation: The author considers the problem of estimating the parameter θ with respect to an independent sample x_1, \dots, x_n from a distribution with density $p_\epsilon(x, \theta) = (1-\epsilon)p(x, \theta) + \epsilon h(x, \theta)$, where $p(x, \theta)$ is a known family of densities and $h(x, \theta)$ is a "contaminated" density which belongs to a predetermined class \mathcal{H} . The estimate $\hat{\theta}$ is sought in the form of a solution of the equation $n^{-1}\sum \omega(x_i, \theta) = 0$, and the problem consists in finding the function ω for which $\inf_{\theta} \sup_{p_\epsilon} M(\hat{\theta} - \theta)$ is realized. This model is a generalization of the Huber model (RZh-Mat, 1965, 12V89) in which θ was the shift parameter. In the "symmetric" case where for any $h \in \mathcal{H}$ and $k > 0$,

"Study of the Hydrolysis Products of Some Ethylenephosphoamides"

Moscow, Khimiko-Farmatsveticheskiy Zhurnal, Vol 6, No 1, Jan 72, pp 51-55

Abstract: Hydrolysis of N-benzyl-N'N'',N'',N'''-diethylenetriamide of phosphoric acid (benzo-TEP) and tetraethyleneamide of p-phenylenediphosphoric acid was studied by thiosulfate determination of ethyleneimine groups and by paper chromatography. After 23 days the entire sample of benzo-TEP was converted to N-benzoyl-N',N''-bis(2-hydroxyethyl)triamide of phosphoric acid. The conversion began at about the third day of the experiment, both products accumulating at the expense of the starting material. Evidently the hydrolysis occurs in two directions: a break in the N-P bond forming the benzamide and addition of water to the two ethyleneimine groups. Most of the benzamide and addition of water to the two ethyleneimine groups. Most of the benzo-TEP (70%) is converted to the benzamide by the first route. Hydrolysis of p-phenylenediphosphoric acid is faster, all of the starting material being fully converted after 6 days to a single product - N,N',N'',N'''-tetra-(2-hydroxyethyl)-tetramide of p-phenylenediphosphoric acid,

"Ultrasonic Treatment of Drilling Solution in Order to Restore its Structural
and Mechanical Properties"

Moscow, Bureniye, No 7, 1973. pp 18-21.

Abstract: A method is studied for restoration of the structural and mechanical properties of solutions by ultrasonic treatment, allowing the restoration of lost properties to be accelerated, while reducing the consumption of materials and expenditures of labor, particularly manual labor, related to the preparation of chemical reagents and treatment of the solution with the reagents. Results are presented from restoration and improvement of these properties during ultrasonic processing directly at drilling sites. The mechanism of action of the ultrasound on natural and artificial solutions is described. The Institute has developed several designs of hydrodynamic vortex-type radiators for production ultrasonic treatment of solutions. These radiators are simple in design and reliable in operation. They can be driven by either centrifugal or piston-type pumps. The mechanism of action of the ultrasound consists in effective

"Structure Formation of $Ti-Cr_3C_2$ During Annealing"

Kiev, Poroshkovaya Metallurgiya, No 1, Jan 74, pp 85-89

Abstract: Structure formation was investigated and composition of the carbide phases was determined during annealing of a Ti-base composite ($Ti-Cr_3C_2$) under conditions similar to those used for sintering titanium alloys. It was shown that in the process of annealing extruded samples at $950\text{--}1250^\circ C$, the chromium carbide dissolves and a new phase -- titanium carbide -- is precipitated. This new phase contained no carbon, which was explained by the non-equilibrium state of the matrix. From determination of phase-structure microhardness after annealing, it was observed that a minimum value of titanium-base microhardness occurs on samples annealed at $1150^\circ C$ when almost 14% Cr is dissolved in the titanium. Three figures, one table, six bibliographic references.

"Method of Processing of Magnesium Ingots"

USSR Author's Certificate No 313908, filed 16/03/70, published 10/11/71,
(Translated from Referativnyy Zhurnal, Metallurgiya, No 5, 1972, Abstract
No 5 G248 P by G. Svodtseva).

Translation: A method of processing of Mg ingots including transportation,
cooling, mechanical working, washing, etching, drying and covering with a pro-
tective layer is proposed. In order to reduce the labor expenditures for
the process and process time, the ingots are subjected to forced cooling to
450-100°, mechanically worked during transportation, and washed at 350-100°.
This reduces labor consumption, decreases the time of the process, and increases
the productivity of labor by 40-80%.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IMMEDIATE AND REMOTE RESULTS OBTAINED FROM ANTI GLAUCOMATOUS OPERATION OF TREPANOIRIDENCLEISIS ARE ANALYZED. IMMEDIATE RESULTS WERE STUDIED ON 247 PATIENTS WITH PRIMARY AND SECONDARY GLAUCOMA. IN CASE OF PRIMARY GLAUCOMA THE OPERATION OF TREPANOIRIDENCLEISIS WAS PERFORMED AT ALL STAGES OF GLAUCOMA AND IN THE PRESENCE OF INDICATIONS TO THIS OPERATION; OF THEM 56 PATIENTS WERE SUBJECTED TO THE OPERATION DURING ACUTE ATTACK OF GLAUCOMA. IMMEDIATELY AFTER THE OPERATION NORMALIZATION OF INTRAOOCULAR TENSION WAS RECORDED IN 90.6PERCENT, FUNCTIONS OF THE EYE IMPROVED IN 42.2PERCENT, AND NO CHANGE WAS ACHIEVED IN 41PERCENT OF CASES. REMOTE RESULTS (1-10 YR FOLLOW UP) WERE ANALYZED IN 147 PATIENTS WITH PRIMARY GLAUCOMA AND 13, WITH SECONDARY GLAUCOMA. APART FROM THIS, RESULTS OF OPERATION WERE ANALYZED IN PATIENTS WITH THE FOLLOW UP PERIOD RANGING FROM 1 TO 4 YR AND FROM 5 TO 10 YR FOLLOWING OPERATION. WITHIN THE 1ST 4 YR FOLLOWING OPERATION A STABLE NORMALIZATION OF INTRAOOCULAR TENSION PERSISTED IN 84.6PERCENT, AND 5-10 YR LATER, IN 82.6PERCENT. IN MORE REMOTE TERMS OF OBSERVATION THE NUMBER OF PATIENTS WITH THE IMPAIRMENT OF VISUAL FUNCTIONS BECAME HIGHER. A STUDY WAS ALSO CARRIED OUT IN RESPECT TO THE STATE OF VISUAL FUNCTIONS IN REMOTE TERMS, DEPENDING ON THE DEGREE OF COMPENSATION OF GLAUCOMATOUS PROCESS, IN 122 PATIENTS, WHEREBY IT WAS STATED THAT VISUAL FUNCTIONS BECAME LOWER, AND A SUGGESTION IS EXPRESSED CONCERNING THE CAUSES OF VISUAL FUNCTION IMPAIRMENT IN PATIENTS WITH NORMALIZED INTRAOOCULAR TENSION.

"Investigation of Temperature Dependences of Modulus of Elasticity and Decrement of Vibrations for the Study of Phase Changes in Cast Irons"

Sb. nauchn. tr. Perm. politekhn. in-t (Collection of Scientific Works of Perm' Polytechnic Institute), 1970, No 73, pp 45-48 (from RZh-Metallurgiya, No 3, Mar 71, Abstract No 31896 by N. Fonshteyn)

Translation: The dynamic modulus of elasticity E and decrement of vibrations δ of white irons (2-3.2% C, 0.7-2.2% Si) were studied in the 20-1050° range. A nonlinear decrease in E with temperature was found. The first inflection on the curve $E = f(T)$ is treated as the recrystallization threshold and the transition to the linear sector as the end of the eutectoid transformation. The curve $\delta = f(T)$, which reveals a growth of internal friction with temperature elevation, displays an inflection corresponding to the beginning of the phase change and a relaxation maximum whose formation temperature is treated as the completion of the transition. On the basis of results of $E = f(T)$ and $\delta = f(T)$ measurements during heating and cooling a conclusion is reached on the effect of C and Si on the magnitude of the phase recrystallization.

on synthetic resins and expanded perlite
contain 0.5-2.5% by weight of the resin of a
quaternary ammonium base having long-chain hydro-
carbon radicals, such as triisoamylamine or
alkamon. The resin content of the material can be
reduced, and its strength and moisture-resistance
are enhanced. Epoxy and coumarone resins are pref.
used. If the resin is introduced into the material
in solution, the ammonium additive is dissolved
in a threefold amount of the same solvent and
admixed to the resin solution. If the resin is
mixed with the perlite in the undissolved state,
the ammonium additive is dissolved in water and
sprinkled onto the mixt. When epoxy resin is used
in an amount of 36 kg. per 1 m.³ of the product
the addition of 1% (by wt. of the resin) of

ammonium compound enhances the strength by 40 -
50%. On the other hand, if the same strength is
required, the amount of the resin can be reduced
to 18 kg. per 1 m.² of the material. 28.4.66. as

A new antitumor antibiotic rubomycin was studied in clinics on cases with various malignant tumors. The preparation was most effective in acute leucosis (objective effect was observed in 36 out of 51 patients), tumoral reticuloses (objective effect was observed in 16 out of 36 patients) and trophoblastic disease (objective effect was observed in 21 out of 40 patients). The preparation had a low toxic effect. Suppression of blood formation was moderate.

G. G. Schastlivyi, A. I. Titko and V. N. Nikolaev: One temperature field problem

Summary

The problem on determining the amount of heat removed into the cooling channel arbitrarily placed in a massive body with internal heat generation is considered for external heat transfer. The problem is solved for a hollow cylinder with prescribed intensity of internal heat generation and intensity of volume sink being determined. Steady-state heat conduction equation for transverse cylinder section with regard for the cooling channel in the single Heaviside η -function is solved by the method of finite Fourier transform on which basis the intensity of heat removal into the channel may be determined with the use of the Newton formula for external heat transfer. As an example, determination of the efficiency of water cooling of a plug of a turbogenerator with a power of 300 mW, in which the magnetic field causes essential inner losses, is presented.

"Phononless Annihilation Radiation of Indirect Excitons in Germanium Crystals With Isoelectronic Impurities"

Leningrad, Fizika Tverdogo Tela, vol 14, No 7, 1972, pp 2004-2007

Abstract: The results are given of experiments performed to study the luminescence of indirect excitons in germanium crystals with isolectronic admixtures of Si and Sn at a temperature of 4.2° K. The DFS-12 spectrometer with a PbS photoresistor was used as a receiver for recording purposes. The luminescence spectrum of a germanium crystal containing an isolectronic Si impurity of 0.7 at. % and a small amount ($5 \cdot 10^{14}$ per cc) of Sb donor material, in which the radiation bands typical of germanium with no silicon are clearly indicated is shown. These bands are the result of the annihilation of free as well as bonded excitons with phonon excitation. The effect on the spectrum of increasing the sensitivity of the equipment and of adding silicon to the crystal specimens is also noted. Investigations were made of the luminescence of free germanium crystal excitons containing Sn, in which phononless annihilation of free excitons with elastic dispersion of the Sn atoms was observed
